

Biological and climatic constraints drive reproductive synchrony

Supplementary figures

Victor, Mike, Lizzie

July 8, 2026

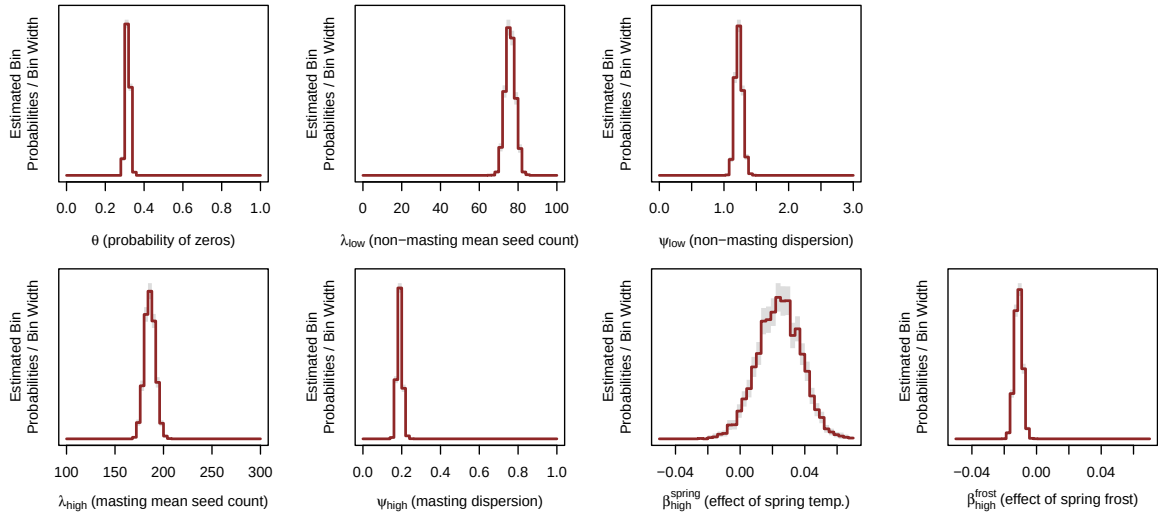

Figure 1: **Posterior distributions of the parameters related to seed count distributions (main text model).**

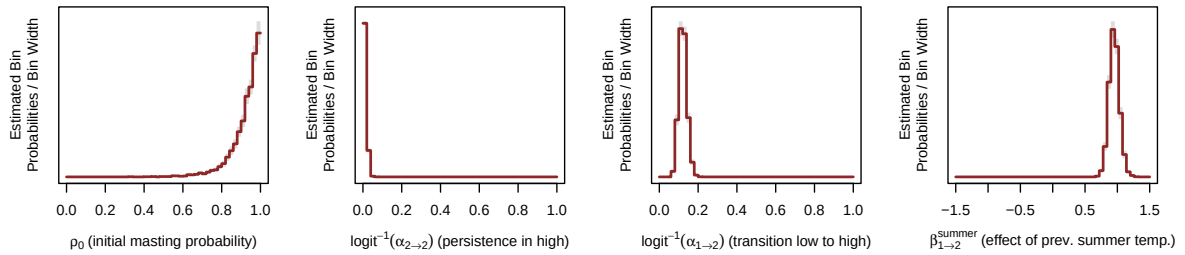

Figure 2: **Posterior distributions of the parameters related to state transitions (main text model).**

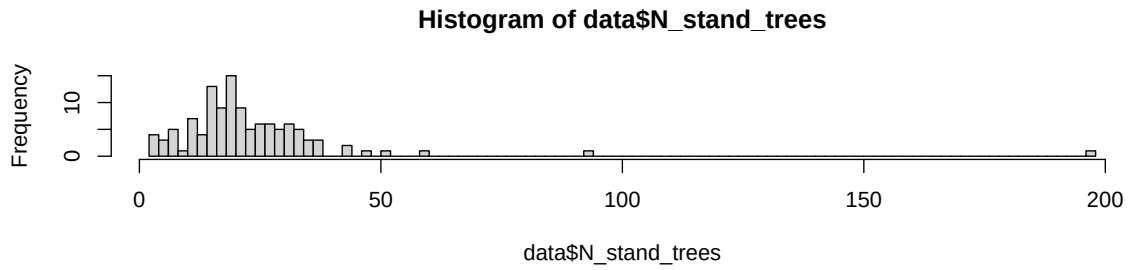

Figure 3: **Posterior distributions of transition probability from low to high reproductive states in a cold vs. a warm summer.**

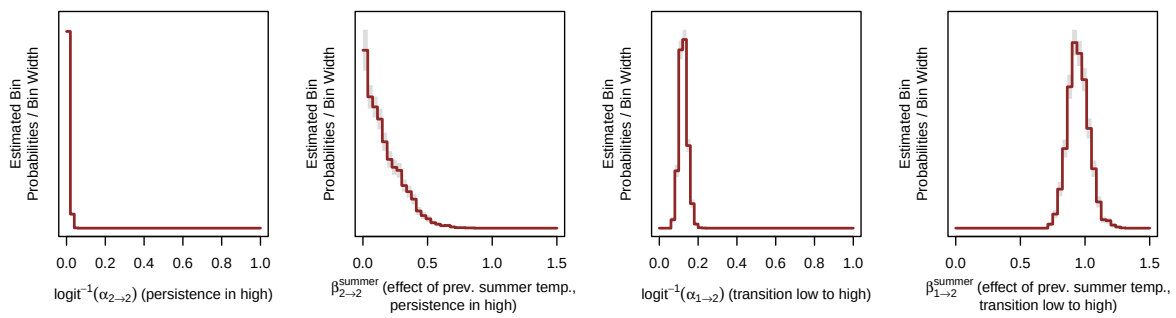

Figure 4: **Posterior distributions of the parameters related to state transitions (model with summer temp. on both transitions).**

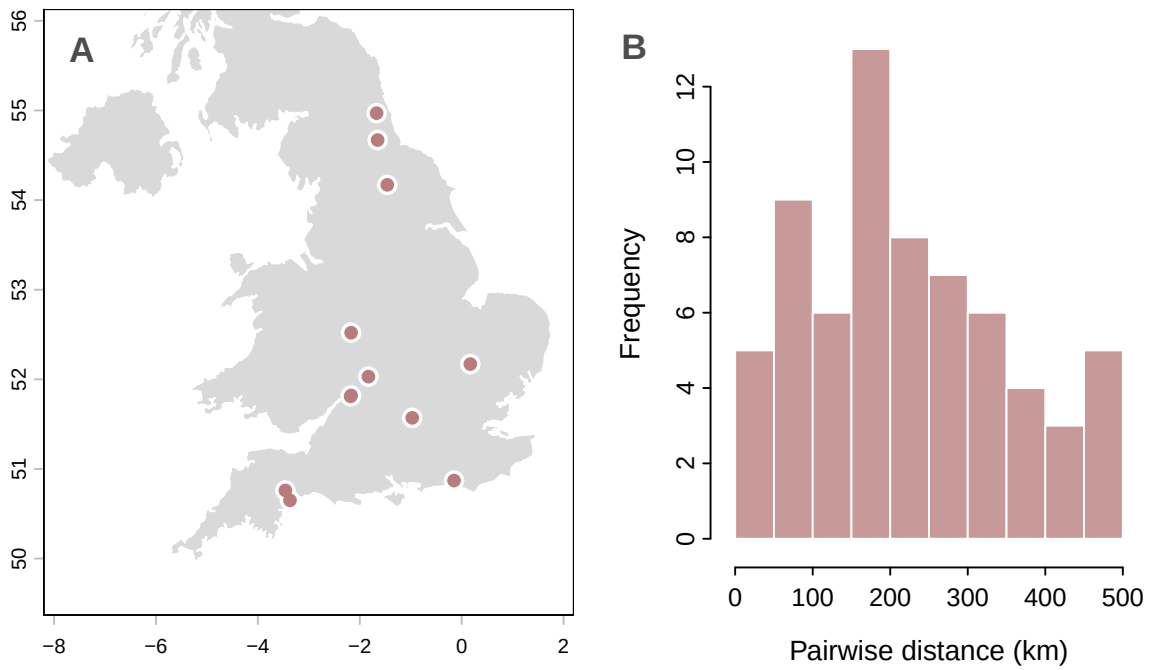

Figure 5: **(A)** Map of the beech forest sites (England). **(B)** Distributions of pairwise distance between sites.

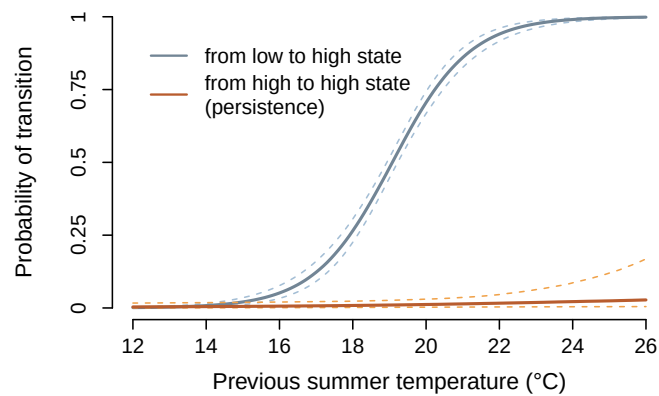

Figure 6: **Effect on previous summer temperature on the probability of transition from a low reproductive to a high reproductive state, and on the probability of persistence in a high reproductive state.**
